Question: 1

Which step is not required when using App To Cloud to migrate an on premises Web Logic Server domain to Oracle Cloud?

Response:

- A. Perform a health check for the on-premises domain.
- B. Create an Oracle Java Cloud Service instance.
- C. Upload the exported domain to cloud storage.
- D. Add a Coherence data- tier to an existing Oracle Java Cloud Service instance.
- E. Perform an import operation on an existing Oracle Java Cloud Service instance.

Answer: D

Question: 2

You can use the backup and restore capabilities of Oracle Cloud Infrastructure Block Volumes to return your Oracle Web Logic Server for Oracle Cloud Infrastructure domain to a specific state, or to recover from a failure. Which statement is wrong?

Response:

- A. You should use the latest available Block Volume backup for creating the Block Volume, so that all the latest WLS config & data are available for restore.
- B. You can either take an immediate backup of the volumes, or you can configure a backup policy that takes a future backup according to the policy's schedule.
- C. When users create a backup from a volume or restore a volume from a backup, the volume and backup don't have to be in the same compartment.
- D. You can restore the data only from full backup and not from incremental backup.

Answer: A

Answer: B

Question: 6

You have deployed a Visual Builder Studio application and shared its URL with the enterprise. The enterprise gives feedback that the deployment is incorrect and does not meet their requirement specifications regarding the URL definition.

Even though the application works as expected, they are insisting that you make corrections to meet their specified requirements. What capabilities in Visual Builder Studio deployment activities would you use to meet this customer requirement?

Response:

- A. Deploy a new version of the application with corrections and have both versions available at the same time.
- B. Undeploy the incorrect version of the application and then redeploy with a custom URL for the deployed application.
- C. Deploy the applications to display a version number or the word "ACTIVE" in the URL of the web application.
- D. Set up the Visual Builder deployment to install the application on an on-premises server in the enterprise's data center.

Answer: D

Question: 7
